

## DESCRIPTION

The HY628100A is a high speed, low power and 1M bit CMOS Static Random Access Memory organized as 131,072 words by 8bit. The HY628100A uses high performance CMOS process technology and designed for high speed low power circuit technology. It is particularly well suited for used in high density low power system application. This device has a data retention mode that guarantees data to remain valid at a minimum power supply voltage of 2.0V.

## FEATURES

- Fully static operation and Tri-state output
- TTL compatible inputs and outputs
- Battery backup(L/LL-part)
  - 2.0V(min) data retention
- Standard pin configuration
  - 32pin 525mil SOP
  - 32pin 8x20mm TSOP-I(Standard)

Product No	Voltage (V)	Speed (ns)	Operation Current(mA)	Standby Current(uA)			Temperature (°C)
				L	LL		
HY628100A	5.0	55/70/85	10	1mA	100	20	0~70

Comment : 50ns is available with 30pF test load.

## PIN CONNECTION

## PIN DESCRIPTION

Pin Name	Pin Function
/CS1	Chip Select 1
CS2	Chip Select 2
/WE	Write Enable
/OE	Output Enable
A0 ~ A16	Address Input
I/O1 ~ I/O8	Data Input/Output
Vcc	Power(5.0V)
Vss	Ground

**TIMING DIAGRAM**

**READ CYCLE 1**

**Note(READ CYCLE):**

1.  $t_{CHZ}$  and  $t_{OHZ}$  are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels
2. At any given temperature and voltage condition,  $t_{CHZ}$  max. is less than  $t_{CLZ}$  min. both for a given device and from device to device.
3.  $/WE$  is high for the read cycle.

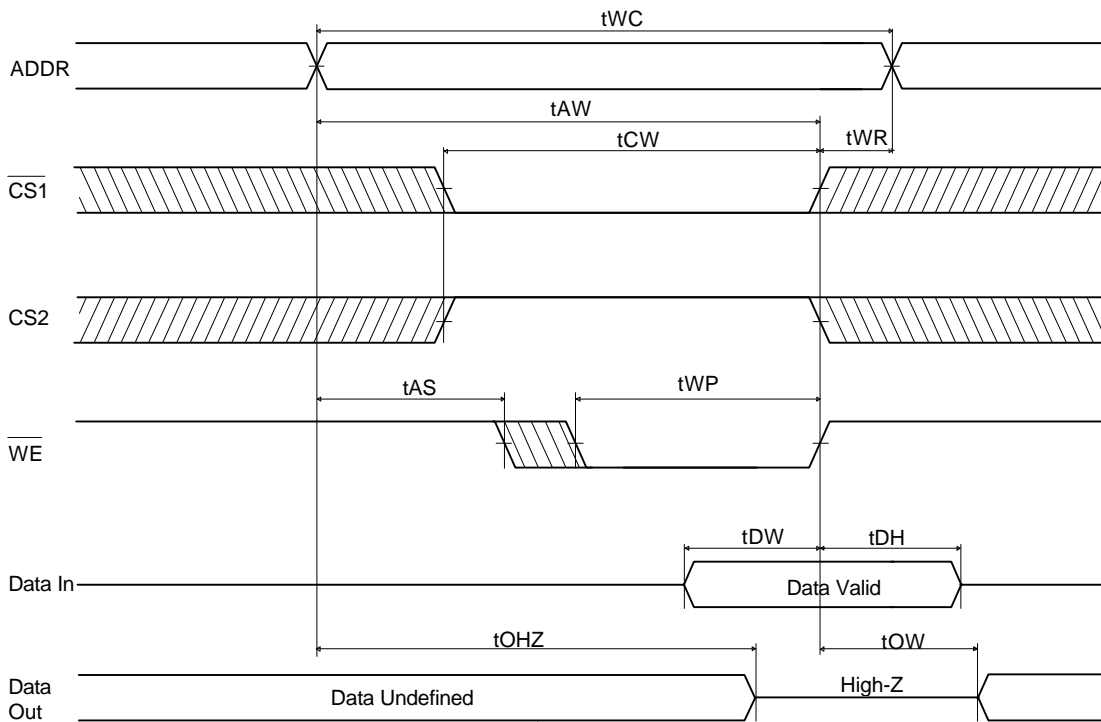

**READ CYCLE 2**

**Note(READ CYCLE):**

1.  $/WE$  is high for the read cycle.
2. Device is continuously selected  $/CS1 = V_{IL}$ ,  $CS2 = V_{IH}$ .
3.  $/OE = V_{IL}$ .

**WRITE CYCLE 1 (/WE Controlled)**

**WRITE CYCLE 2 (/CS1 Controlled)**

**WRITE CYCLE 3 (CS2 Controlled)**

**Notes(WRITE CYCLE):**

1. A write occurs during the overlap of a low /CS1, CS2 and low /WE. A write begins at the latest transition among /CS1 going low, CS2 going high and /WE going low: A write ends at the earliest transition among /CS1 going high, CS2 low and /WE going high.  $t_{WP}$  is measured from the beginning of write to the end of write.
2.  $t_{CW}$  is measured from the later of /CS1 going low or CS2 going high to the end of write .
3.  $t_{AS}$  is measured from the address valid to the beginning of write.
4.  $t_{WR}$  is measured from the end of write to the address change.  $t_{WR}$  is applied in case a write ends as /CS1, or /WE going high, and  $t_{WR}$  is applied in case a write ends at CS2 going low.
5. If /OE, CS2 and /WE are in the read mode during this period, the I/O pins are in the output low-Z state, input of opposite phase of the output must not be applied because bus contention can occur.
6. If /CS1 goes low simultaneously with /WE going low, the outputs remain in high impedance state.
7. Dout is the read data of the new address.
8. When /CS1 is low and CS2 is high, I/O pins are in the output state. The input signals in the opposite phase leading to the outputs should not be applied.
