Preliminary   *64K X 8 LOW VOLTAGE OTP CMOS EPROM*
Features

- 65,536 X 8 bit organization
- Programming voltage: 12.75V
- VCC power supply range: 3.0V to 3.6V
- Access time: 120 ns (max.)
- Current: Operating: 15mA (max.)
             Standby: 50µA (max.)

- All inputs and outputs are directly TTL-compatible
- Available in 28-pin DIP and 32-PLCC packages

General Description

The A27L6308 chip is a low-voltage 524,288 bit one-time programmable read only memory (OTP EPROM) organized as 64K by 8 bits. The A27L6308 requires only 3.3V power supply in normal read mode operation and any input signals are TTL levels. The A27L6308 is available in industry standard 28 pin dual-in-line and 32 lead PLCC packages.

Pin Configurations

■ DIP

■ PLCC

Functional Description

Read Mode

The A27L6308 has two control functions, both of which must be logically active in order to obtain data at the outputs. $\overline{CE}$ is the power control and should be used for device selection. $\overline{OE}$ is the output control and should be used to data to the output pins, which is independent of device selection. Assuming that addresses are stable, address access time (t_{AA}) is equal to the delay from $\overline{CE}$ to output (t_{CE}). Data is available at the output after a delay (t_{OE}) from the falling edge of $\overline{OE}$, as long as $\overline{CE}$ has been low and the addresses have been stable for at least t_{AA} - t_{OE}.

Standby Mode

The A27L6308 has a standby mode which reduces the active current from 15mA to 50μA. The A27L6308 is placed in the standby mode by applying a CMOS high signal to $\overline{CE}$. When in the standby mode, the output are in a high impedance state, independent of the $\overline{OE}$.

Auto Identify Mode

The auto identify mode allows the reading out of a binary code from a EPROM that will identify its manufacturer and type. This mode is intended for use by programming equipment for the purpose of automatically matching the device to be programmed with its corresponding programming algorithm.

To activate the mode, the programming equipment must apply 12.0V $\pm$ 0.5V on address line A9 of the A27L6308. Three identification code can be read from data output pin by toggling A0 and A1. The other addresses must be held at V_{IL} during this mode. Byte 0 (with A0 at V_{IL}, A1 at V_{IL}) represents the manufacturer code which is 37H. Byte 1 and Byte 2 represent the device code and continuation code, which is 3DH and 7FH respectively. All identifiers for these codes will possess odd parity, with MSB (IO_7) defined the parity bit.

Absolute Maximum Ratings*

Ambient Operating Temperature (T_A) . . . . -10°C to +85°C
Storage Temperature Plastic Package (T_{STG}) . . . .
. . . . -55°C to 125°C
Applied Input Voltage (V_I):
    All Pins Except A9, VPP and VCC . . . .
. . . . -0.6V to VCC + 0.6V
    A9, VPP . . . . -0.6V to 13.5V
    VCC . . . . -0.6V to 7.0V
Output Voltage (V_O) . . . . -0.6V to 7.0V (Note 1)

*Comments

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

Notes:
1. During voltage transitions, the input may undershoot GND to -2.0V for periods less than 20 ns. Maximum DC voltage on input and I/O may overshoot to VCC + 2.0V for periods less than 20 ns.
2. When transitions, A9 and VPP may undershoot GND to -2.0V for periods less than 20 ns. Maximum DC input voltage on A9 and VPP is +13.5V which may overshoot to 14.0V for period less than 20 ns.

Read Mode DC Electrical Characteristics (Ta = 0°C to 70°C, VCC = 3.3V ± 10%, VPP = VCC)

Symbol	Parameter	Min.	Max.	Unit	Conditions
V_{OH}	Output High Voltage	2.4		V	I_{OH} = -100μA
V_{OL}	Output Low Voltage		0.45	V	I_{OL} = 1.6mA

Programming and Program Verify

The programming flowchart is shown in Page 10.

The A27L6308 is shipped with all bits being set to "1". Programming causes relevant bits to be changed to "0". The programming mode is started by setting VCC to 6.25V, $\overline{OE}$/VPP to +12.75V and $\overline{CE}$ is at V$_{IL}$. Data to be programmed can be directly input in the 8 bit format through the data bus.

The write programming algorithm reduces programming time by using 100µs pulse followed by a byte verification to determine whether the byte has been successfully programmed. If the data does not pass the verification,

an additional pulse programming is applied for a maximum of 25 pulses. On completion of 1 byte programming and, The verified address is incremented. After the final address is completed, all bytes are verified again with VCC = 5.0 Volt.

Program Inhibit

This mode is used to program one of multiple A27L6308 whose VCC, address bus and data bus are connected in parallel. When programming is performed, other A27L6308 can be inhibited from being programmed by setting their $\overline{CE}$ pins to V$_{IH}$ and $\overline{OE}$/VPP pins to +12.75V.
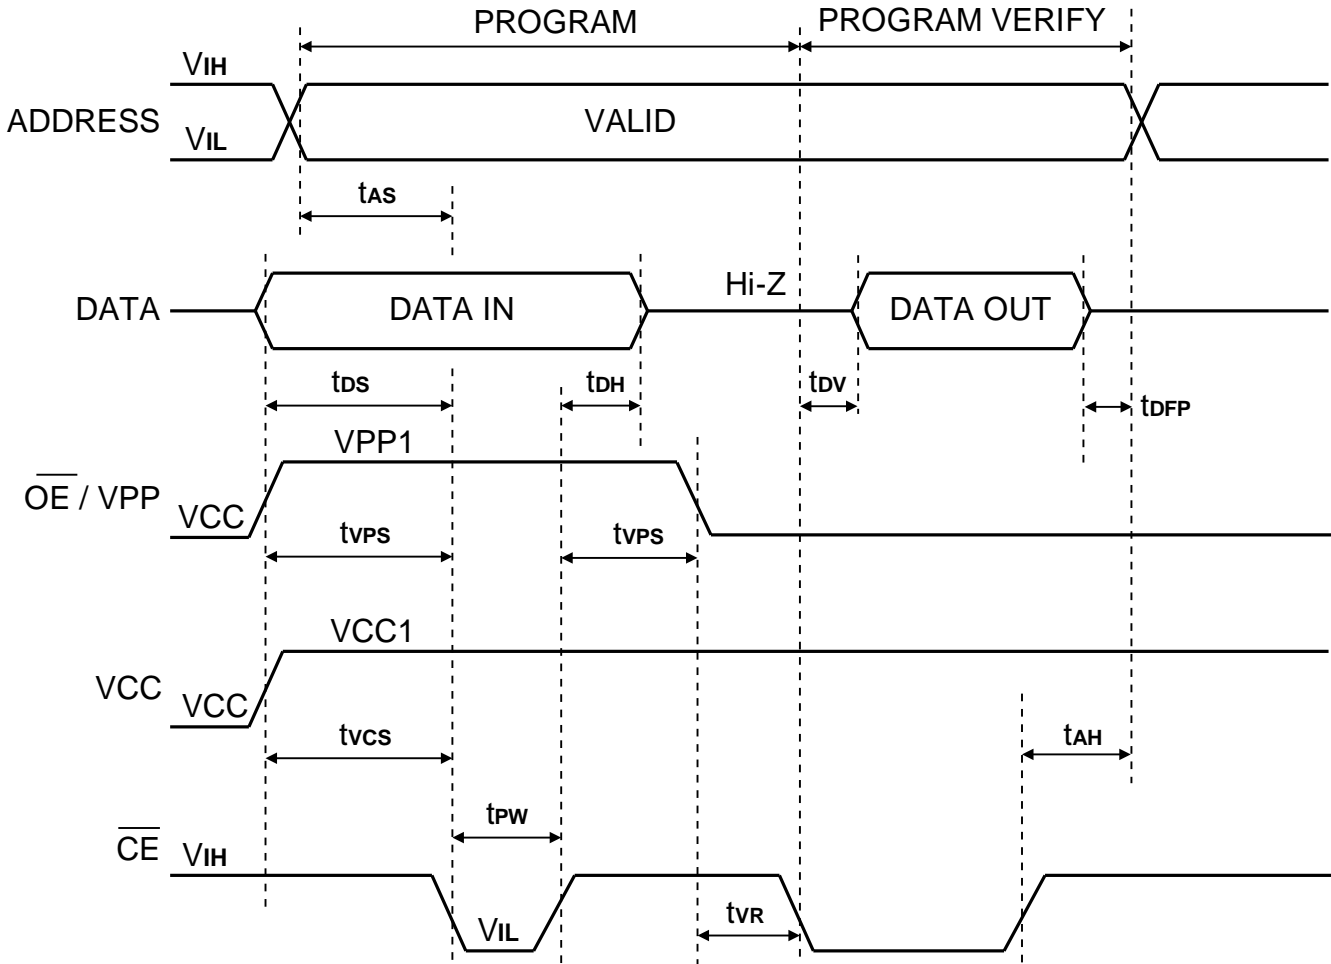

**Programming Mode DC Characteristics** (Ta = 0°C to 70°C, VCC = 6.25V ± 0.25V, VPP = 12.75V ± 0.25V)

Symbol	Parameter	Min.	Max.	Unit	Test Conditions
V$_{IH}$	Input High Voltage	2.0	VCC + 0.5	V	
V$_{IL}$	Input Low Voltage	-0.5	0.6	V	
I$_{LI}$	Input Leakage Current	-1	+1	µA	VCC = max. Vin = 0V to VCC
Icc	VCC Current During Program		50	mA	
I$_{PP}$	VPP Current During Program		50	mA	$\overline{CE}$ = V$_{IL}$
V$_{ID}$	A9 Auto Select Voltage	11.5	12.5	V	A9 = V$_{ID}$
VCC1	Programming Supply Voltage	6.0	6.5	V	
VPP1	Programming Voltage	12.5	13	V	

Note: VCC must be applied simultaneously or before VPP and removed simultaneously or after VPP.

Programming Mode AC Characteristics (Ta = 0°C to 70°C, VCC= 6.25V ± 0.25V, VPP = 12.75V ± 0.25V)

Symbol	Parameter	Min.	Max.	Unit
t$_{AS}$	Address Valid to Program Low	2		μs
t$_{DS}$	Input Valid to Program Low	2		μs
t$_{VPS}$	VPP Set up Time	2		μs
t$_{VCS}$	VCC Set up Time	2		μs
t$_{PW}$	Program Pulse Width	95	105	μs
t$_{DH}$	Data Hold Time	2		μs
t$_{VR}$	$\overline{OE}$ / VPP Recovery Time	2		μs
t$_{DV}$	Data Valid from $\overline{CE}$		100	ns
t$_{DFP}$	Chip Enable to Output Float Delay		130	ns
t$_{AH}$	Address Hold Time	0		ns
