The Intel® 2149H is a 4096-bit static Random Access Memory organized as 1024 words by 4 bits using HMOS II, a high performance MOS technology. It provides a maximum chip select access time as low as 20 ns instead of an automatic power-down feature. This fast chip select access time feature increases system throughput. An automatic power-down companion, the 2148H, is available for power critical applications.

The 2149H is assembled in an 18-pin package configured with the industry standard 1Kx4 pinout. It is directly TTL compatible in all respects: inputs, outputs and a single +5V supply. The data is read out non-destructively and has the same polarity as the input data.

**COMMENT: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

Notes:

1. The operating ambient temperature range is guaranteed with transverse air flow exceeding 400 linear feet per minute. Typical thermal resistance values of the package at maximum temperatures are:
   θ_{JA} (@ 400 f_{PM} air flow) = 40° C/W
   θ_{JA} (still air) = 70° C/W
   θ_{JC} = 25° C/W
2. Typical limits are at V_{CC} = 5V, T_A = +25°C, and Load A.
