## 256K (32K x 8) Low-Voltage CMOS EPROM

### FEATURES

- Wide voltage range 3.0V to 5.5V
- High speed performance
  - 200 ns access time available at 3.0V
- CMOS Technology for low power consumption
  - 8 mA Active current at 3.0V
  - 20 mA Active current at 5.5V
  - 100  $\mu$ A Standby current
- Factory programming available
- Auto-insertion-compatible plastic packages
- Auto ID aids automated programming
- Separate chip enable and output enable controls
- High speed "Express" programming algorithm
- Organized 32K x 8: JEDEC standard pinouts
  - 28-pin Dual-in-line package
  - 32-pin PLCC package
  - 28-pin SOIC package
  - Tape and reel
- Data Retention > 200 years
- Available for the following temperature ranges:
  - Commercial: 0°C to +70°C
  - Industrial: -40°C to +85°C

### DESCRIPTION

The Microchip Technology Inc. 27LV256 is a low voltage (3.0 volt) CMOS EPROM designed for battery powered applications. The device is organized as a 32K x 8 (32K-Byte) non-volatile memory product. The 27LV256 consumes only 8 mA maximum of active current during a 3.0 volt read operation therefore improving battery performance. This device is designed for very low voltage applications where conventional 5.0 volt only EPROMS can not be used. Accessing individual bytes from an address transition or from power-up (chip enable pin going low) is accomplished in less than 200 ns at 3.0V. This device allows systems designers the ability to use low voltage non-volatile memory with today's low voltage microprocessors and peripherals in battery powered applications.

A complete family of packages is offered to provide the most flexibility in applications. For surface mount applications, PLCC or SOIC packaging is available. Tape and reel packaging is also available for PLCC or SOIC packages.

### PACKAGE TYPES

#### PDIP

#### PLCC

#### SOIC

# 27LV256

## 1.0 ELECTRICAL CHARACTERISTICS

### 1.1 Maximum Ratings\*

VCC and input voltages w.r.t. VSS ..... -0.6V to +7.25V

VPP voltage w.r.t. VSS during programming ..... -0.6V to +14V

Voltage on A9 w.r.t. VSS ..... -0.6V to +13.5V

Output voltage w.r.t. VSS ..... -0.6V to VCC +1.0V

Storage temperature ..... -65°C to +150°C

Ambient temp. with power applied ..... -65°C to +125°C

\*Notice: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 1-1: PIN FUNCTION TABLE

Name	Function
A0-A14	Address Inputs
$\overline{CE}$	Chip Enable
$\overline{OE}$	Output Enable
VPP	Programming Voltage
O0 - O7	Data Output
VCC	+5V or +3V Power Supply
VSS	Ground
NC	No Connection; No Internal Connection
NU	Not Used; No External Connection Is Allowed

TABLE 1-2: READ OPERATION DC CHARACTERISTICS

VCC = +5V ±10% or 3.0V where indicated							
Commercial: Tamb = 0°C to +70°C							
Industrial: Tamb = -40°C to +85°C							
Parameter	Part*	Status	Symbol	Min.	Max.	Units	Conditions
Input Voltages	all	Logic "1"	V <sub>IH</sub>	2.0	V <sub>CC</sub> +1	V

VPP Set-Up Time	tVPS	2	—	$\mu\text{s}$		
Data Valid from $\overline{\text{OE}}$	tOE	—	100	ns		

Note 1: For express algorithm, initial programming width tolerance is 100  $\mu\text{s} \pm 5\%$ .

2: This parameter is only sampled and not 100% tested. Output float is defined as the point where data is no longer driven (see timing diagram).

**FIGURE 1-2: PROGRAMMING WAVEFORMS**

**TABLE 1-6: MODES**

Operation Mode	$\overline{CE}$	$\overline{OE}$	VPP	A9	O0 - O7
Read	VIL	VIL	VCC	X	DOUT
Program	VIL	VIH	VH	X	DIN
Program Verify	VIH	VIL	VH	X	DOUT
Program Inhibit	VIH	VIH	VH	X	High Z
Standby	VIH	X	VCC	X	High Z
Output Disable	VIL	VIH	VCC	X	High Z
Identity	VIL	VIL	VCC	VH	Identity Code

X = Don't Care

## 1.2 Read Mode

(See Timing Diagrams and AC Characteristics)

Read Mode is accessed when:

- the  $\overline{CE}$  pin is low to power up (enable) the chip
- the  $\overline{OE}$  pin is low to gate the data to the output pins

For Read operations, if the addresses are stable, the address access time ( $t_{ACC}$ ) is equal to the delay from  $\overline{CE}$  to output ( $t_{CE}$ ). Data is transferred to the output after a delay from the falling edge of  $\overline{OE}$  ( $t_{OE}$ ).

# 27LV256

## 1.3 Standby Mode

The standby mode is defined when the  $\overline{CE}$  pin is high ( $V_{IH}$ ) and a program mode is not defined. Output Disable

## 1.4 Output Enable

This feature eliminates bus contention in multiple bus microprocessor systems and the outputs go to a high impedance when the following condition is true:

- The  $\overline{OE}$  pin is high and program mode is not defined.

## 1.5 Programming Mode

The Express algorithm has been developed to improve on the programming throughput times in a production environment. Up to 10 100-microsecond pulses are applied until the byte is verified. No over-programming is required. A flowchart of the express algorithm is shown in Figure 1.

Programming takes place when:

- a)  $V_{CC}$  is brought to the proper voltage
- b)  $V_{PP}$  is brought to the proper  $V_H$  level
- c) the  $\overline{OE}$  pin is high
- d) the  $\overline{CE}$  pin is low

Since the erased state is "1" in the array, programming of "0" is required. The address to be programmed is set via pins A0-A14 and the data to be programmed is presented to pins O0-O7. When data and address are stable, a low-going pulse on the  $\overline{CE}$  line programs that location.

## 1.6 Verify

After the array has been programmed it must be verified to ensure that all the bits have been correctly programmed. This mode is entered when all of the following conditions are met:

- a)  $V_{CC}$  is at the proper level
- b)  $V_{PP}$  is at the proper  $V_H$  level
- c) the  $\overline{CE}$  pin is high
- d) the  $\overline{OE}$  line is low

## 1.7 Inhibit

When Programming multiple devices in parallel with different data, only  $\overline{CE}$  needs to be under separate control to each device. By pulsing the  $\overline{CE}$  line low on a particular device, that device will be programmed, and all other devices with  $\overline{CE}$  held high will not be programmed with the data although address and data are available on their input pins.

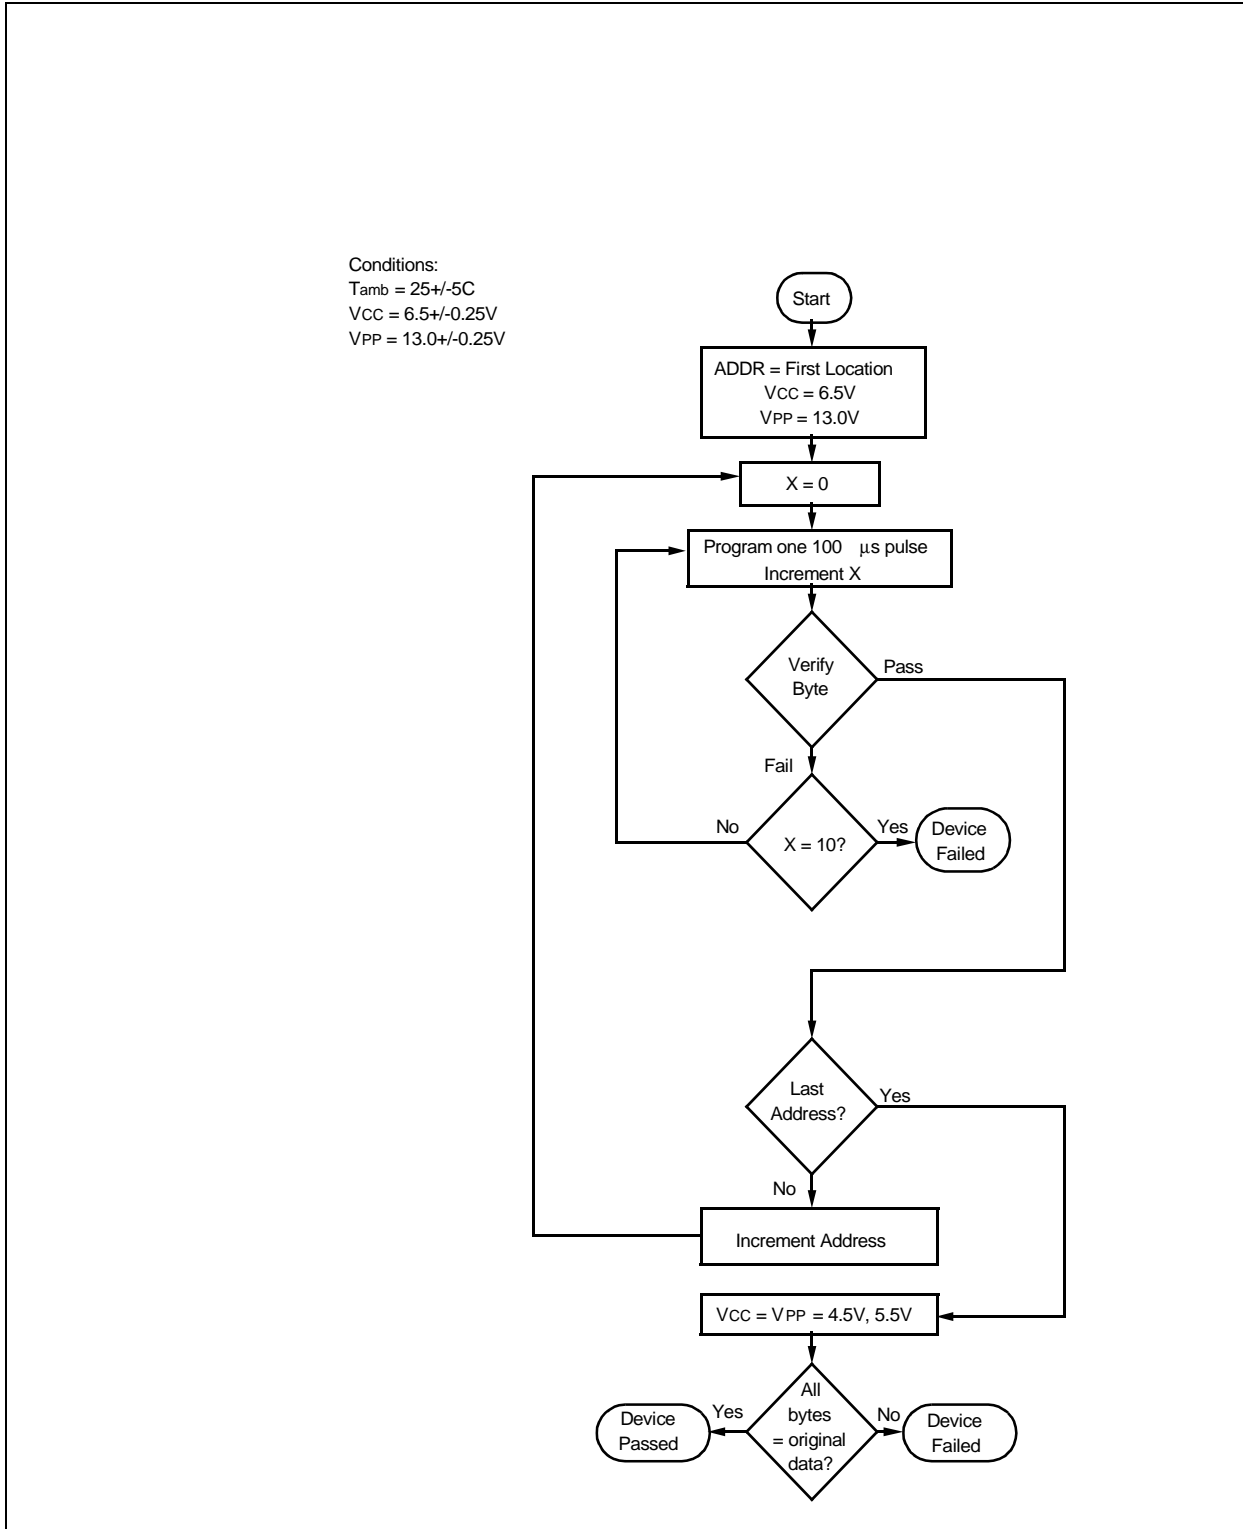

## 1.8 Identity Mode

In this mode specific data is outputted which identifies the manufacturer as Microchip Technology Inc. and device type. This mode is entered when Pin A9 is taken to  $V_H$  (11.5V to 12.5V). The  $\overline{CE}$  and  $\overline{OE}$  lines must be at  $V_{IL}$ . A0 is used to access any of the two non-erasable bytes whose data appears on O0 through O7.

Pin →	Input	Output									
Identity ↓	A0	0	0	0	0	0	0	0	0	0	H
		7	6	5	4	3	2	1	0		e
Manufacturer	$V_{IL}$	0	0	1	0	1	0	0	1	29	
Device Type*	$V_{IH}$	1	0	0	0	1	1	0	0	8C	

\* Code subject to change.

## 27LV256 Product Identification System

To order or to obtain information, e.g., on pricing or delivery, please use the listed part numbers, and refer to the factory or the listed sales offices.

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM  
CERTIFIED BY DNV  
== ISO/TS 16949:2002 ==**

*Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
